

# TicTacToes

So easy, you could play with your toes! Try it at: <http://tictactoes.co.vu/>

---

## Development setup for osx

1. Navigate to: <https://tictacboxen.herokuapp.com/>
2. Copy script to terminal and run boxen
3. Get yourself some coffee while script finishes.

Thats it!

Boxen automagically sets up everything you would ever need to develop tictactoes on your mac. Including git, java, maven and a whole bunch of other things.

You can find all the config files for our boxen here: <https://github.com/0xabad1deaf/boxen> This is how we set up all our new macs here at 0xabad1dea

What about linux, or windows? Boxen only works on Mac OS X (Mountain Lion or above) and that's what we hack on every day. See below for basic linux/Windows tictactoe development setup requirements.

---

## Prerequisites

To run Tic Tac Toes on your local machine you will need the following:

- Git
- Java 1.7
- Maven
- If you are on windows, you will need to setup Powershell or a bash shell e.g putty or equivalent before anything else.

---

## Quick Start

1. Clone the repo to your local machine git clone <https://github.com/0xabad1deaf/Lateterm>
2. Package and run

`bin/package` `bin/run`

This should automatically install all dependencies and fire up a local Jetty server listening on port 4567.
